

**IN THE SPECIFICATION:**

AI [45] Consideration of the sequence of figures 5-9 shows that the worm wheel has only been driven in a clockwise direction (figures 7,8, and 9) but that the output ~~lever~~element is manually moved from the position shown in figure 5 to the position shown in figure 6. Thus by alternate manual and power operation it can be seen that the worm wheel only rotates in one direction and in particular the worm wheel rotates through 360° for every manual/powered sequence as shown in figures 5-9. Thus, if required, the worm wheel can be operated in such a manner that it continually rotates in the same direction.
